

Project 1

This is the first time I have worked with html and doing any sort of webpage designing. Having a slight background in coding it didn't take long to understand the formatting, however it took a bit to adjust to the specific nuances of the html language. I created this page using Visual Studio Code, I found the software to be very helpful because of its ability to show a live preview of the webpage I was creating while doing the editing. This made it easier to pinpoint any mistakes in the code before moving on to a more complicated step.

Zybooks was able to provide a general understanding of how to set up lists and divide the contents of my page into different sections. Even though it took a little more effort in order to fully understand how to use the different tags effectively. I found that it was difficult to produce the exact format I wanted for my webpage off the concepts taught in there. It seemed as though I was scratching the surface of html but it wasn't enough to perfect my own page

My webpage was tested on Chrome and Microsoft Edge both had no noticeable differences in displaying the materials effectively. I turned to W3schools for more help, it was able to provide an in-depth explanation on how to use all of the tags and CSS that appears on my page. I feel that this is a great resource in order to expand my knowledge on how to effectively implement each different tag properly and to the fullest. There were a few issues when verifying my code at first, the webpage still loaded however the code itself was not fully sound. Thankfully they were easy fixes and this showcased the restrictions involved in html.
